Exercise 02 Efficient Algorithms

$\mathbf{Ex} \ \mathbf{1}$

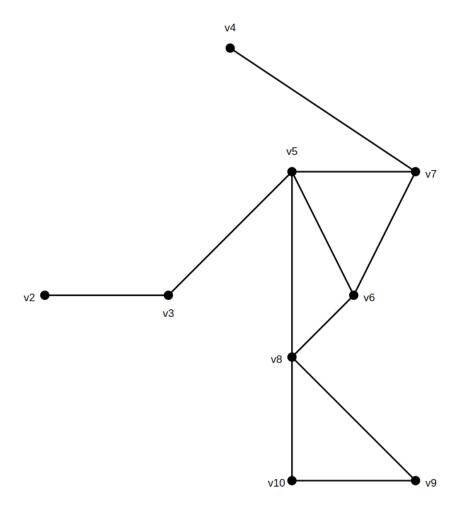

after 1. iteration:

- $\bullet~$ v11 was deleted.
- S and U are updated since 13/10 > 14/11

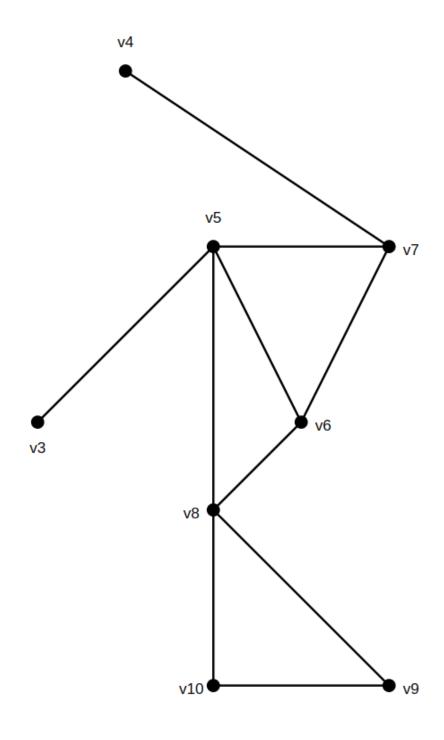

after 2. iteration:

- \bullet v1 was deleted.
- S and U are not updated since 11/9 < 13/10

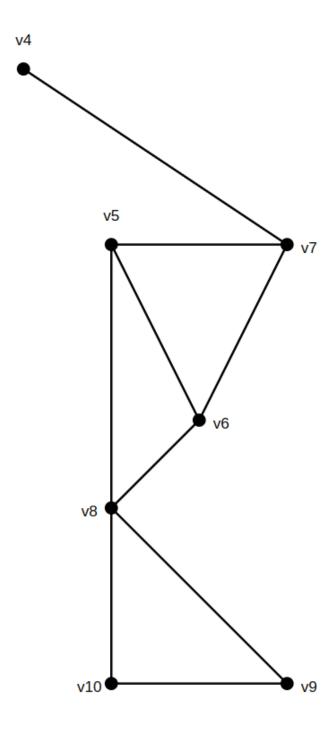

after 3. iteration:

- v2 was deleted. • S and U are not updated since 10/8 < 13/10

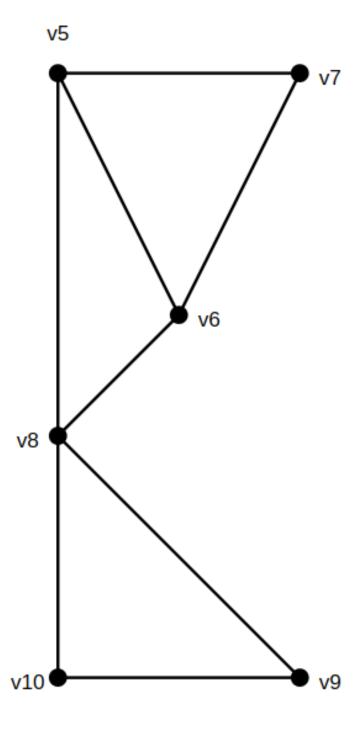

after 4. iteration:

- v3 was deleted.
- S and U are not updated since 9/7 < 13/10

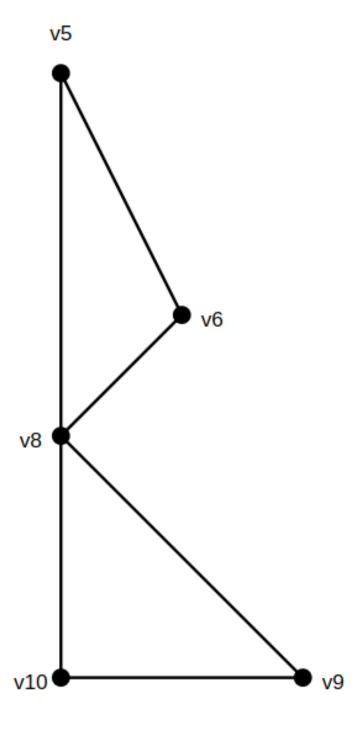

after 5. iteration:

- v4 was deleted.
- S and U are updated since 8/6 > 13/10

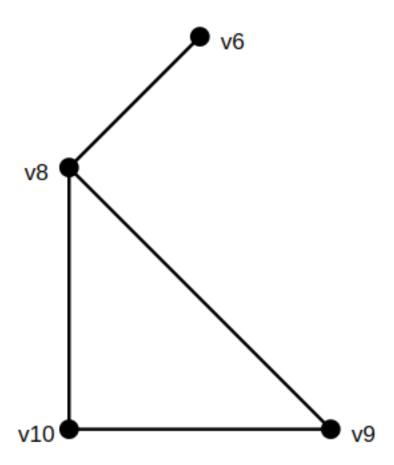

after 6. iteration:

- v7 was deleted. • S and U are not updated since 6/5 < 8/6

after 7. iteration:

- v5 was deleted.
- S and U are not updated since 4/4 < 8/6

after 8. iteration:

- v6 was deleted.
- S and U are not updated since 3/3 < 8/6

after 9. iteration:

- v8 was deleted.
- S and U are not updated since 1/2 < 8/6

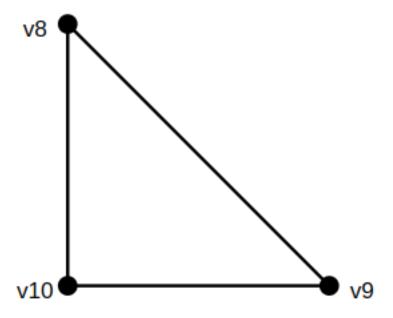

Figure 1: image

v10 ● v9

after 10. iteration:

- v9 was deleted.
- S and U are not updated since 0 < 8/6

v10 ●

=> returned S is $\{v5, v6, v7, v8, v9, v10\}$

a)
$$Pr(X=3) = \frac{5}{6} \cdot \frac{5}{6} \cdot \frac{1}{6} = \frac{25}{216} \approx 0.1157$$
b) $Pr(X=k) = \frac{5}{6} \cdot \frac{5}{6} \cdot \frac{5}{6} \cdot \frac{1}{6} = (\frac{5}{6})^{k-1} \cdot \frac{1}{6}$ for $k \in \mathbb{N}$

first roll

 $\neq 6$
 $\neq 6$
 $\neq 6$
 $\neq 6$
 $\neq 6$
 $\Rightarrow 6$
 \Rightarrow

$$P_{\Gamma}(X \le 3) = P_{\Gamma}(X = 1) + P_{\Gamma}(X = 2) + P_{\Gamma}(X = 3)$$

$$= \frac{1}{6} + \frac{5}{36} + \frac{25}{216} = \frac{91}{216} \approx 0,4213$$

Let Y be the random variable, that denotes the number $X \leq 3$ results in ten attempts as described in the task.

$$Pr(Y=k) = \binom{10}{k} Pr(X \le 3)^{k} (1 - Pr(X \le 3))^{10-k}$$

for $k \in [0, 10]$

c)
$$Pr(Y = 10) = Pr(X \le 3)^{10} = (\frac{91}{216})^{10} \approx 6,00018$$

$$d) E(Y) = \sum_{i=0}^{10} i \cdot Pr(Y=i)$$

$$= \sum_{i=0}^{10} (10) \Pr(X \le 3) (1 - \Pr(X \le 3))^{10-i}$$

Bernoulli-Distribution expected value =
$$10 \cdot Pr(X \le 3) = \frac{910}{216} \approx 4.213$$

Algorithm 1 Cluster Formation with Blackbox Function

```
1: clusters \leftarrow \emptyset

2: for each a in P do

3: currentCluster \leftarrow \{a\}

4: for each b in P do

5: if d(a,b) \leq r then

6: currentCluster \leftarrow currentCluster \cup \{b\}

7: end if

8: end for

9: clusters \leftarrow clusters \cup currentCluster

10: end for

11: result \leftarrow blackbox(\mathcal{T} = clusters, N = k)

12: return result
```

b)

This would not be possible since the distance to the cluster center is not known prior to running the algorithm in the standard k-center problem. Therefore there is no metric we could use to assign possible cluster points to the cluster centers.

c)

Algorithm 2 Cluster Formation with known OPT

```
1: clusters \leftarrow \emptyset
 2: while P \neq \emptyset do
       currentCenter \leftarrow \text{some } c \in P
       currentCluster \leftarrow \emptyset
 4:
       for each p in P do
          if d(c, p) \leq 2OPT then
 6:
             currentCluster \leftarrow currentCluster \cup \{p\}
 7:
          end if
 8:
       end for
 9:
       clusters \leftarrow clusters \cup currentCluster
10:
       P \leftarrow P \setminus currentCluster
11:
12: end while
13: return clusters
```
